V0.3 - 26 sept. 2013

1. Introduction

In the recent years, several FP7 projects have aimed at defining the building blocks of Solar System Virtual observatories, from the Sun to the planets: Europlanet¹, HELIO², IMPEX³. Europlanet (Planetary Sciences) and HELIO (Heliophysics) have been trying to use IVOA⁴ standards as much as possible in the data models and protocols they have selected and implemented.

Inside the Europlanet program, the IDIS⁵ group has been focusing on setting up the basis of a Planetary Science Virtual Observatory. This group has developed a data model (EPN-DM) which is used to describe the services and resources that are made available. The EPN-DM is using IVOA standards. However, due to the large variety of science thematics (*Sun, planets, atmospheres, surfaces, interiors, small bodies, orbital parameters, in situ exploration, plasma (waves, particle and fields), radio astronomy...*), the IVOA standards have been sometimes extended in their allowed keyword values, and new keywords have also been forged when necessary. Solar System science also conveys a large variety of data types (images, spectra, times series, movies, dynamic spectra, profiles, maps...), which also have to be described. An even larger variety of physical parameters is present (including remote data, in-situ data, laboratory experiments, field analogs). All these aspects made the IVOA standard adoption not so easy.

From the beginning of the investigations, we decided that we needed a keyword describing the "measurement type" (i.e., a generic information on the data, in terms of physical parameters). The "measurement type" concept is already present in SPASE⁶, which is a data model used in space physics. More details on the SPASE concepts applicable to that study, are provided in Appendix 1. The SPASE group is providing a list of values, adapted to its scope, but too restrictive for the general planetary sciences. The SPASE data model has been built without interaction with IVOA, hence, there is (yet) no easy way to translate automatically between the two worlds. For EPN developments, we have chosen to keep the "measurement type" concept, and tried to use UCDs instead of the SPASE "measurement types". We discuss in this document whether this is feasible. We have also compared the UCDs with the Planetary Science Data Dictionary⁷ (from the NASA PDS⁸). We have set up an online tool where we store the correspondences between the SPASE, PDS and IVOA concept in terms of content descriptors: <http://typhon.obspm.fr/idis/ucd.php>, which includes a basic search interface.

As stated in the IVOA documentation, a UCD⁹ is defined as a Controlled Vocabulary for Astronomy. The concepts present in UCDs are strongly linked to astrophysics, but they can be used in a wider frame, such as planetary sciences or heliophysics. However, in many cases, when enlarging the scope of a UCD, it usually implies to modify its definition. Such modifications will be presented and discussed in this document. It is important to note that UCDs are not a data model. Indeed, there is a strong temptation from the unexperienced user to use UCDs to describe the parameters at a too refined level. We will present examples and discuss them.

Notes for the following section tables

- **Bold face** UCDs are new UCDs proposed for evaluation to the IVOA semantics group.
- "Suggested UCDs" are the initial propositions by the study groups, before discussion.
- "Proposed UCDs" are the proposition after internal discussion and comparison between the various cases studied.

2. UCDs for Planetary Sciences

The main source for the inputs provided here were discussed within the Europlanet-RI/IDIS group. Several aspects were studied specifically: "Comets and Samples", "Space Physics", and "Imaging and Spectroscopy". We will present this three cases separately, as they are addressing different conceptual aspects.

Case 1: Comets and Samples

The inputs for this science topic were provided by the "Small Body and Dynamics nNode" (italian EPN/IDIS group). They are willing to describe asteroid, cometary and samples data. They proposed a full list of new specific UCDs that cover their physical parameters. We have reviewed those propositions and proposed more generic UCDs instead. The resulting list is very restrictive, as this type of data is not present in astrophysics.

The list of descriptors can be divided into 2 series: the aspect description (usually defined by eye) and the physical description (measurements).

Table 1. List of "aspect UCDs" proposed for Comets and Samples.

Suggested UCD	Proposed UCD	Note
phys.sample	src.sample;meta.code.class	related to samples collected within the solar system on Moon, Earth, Mars...
phys.sample.alt	src.sample;pos.bodyrc.alt	altitude of the finding location
phys.sample.approxloc	src.sample;pos;meta.note	approximate location of the finding in the case that a precise coordinate is unavailable, e.g.: 'Mare Serenitatis', 'Sahara desert'...
phys.sample.cluster	src.sample;meta.id.parent	Eventually indicates the cluster to which the sample belongs
phys.sample.color	src.sample;meta.code.class	color of an object, generally assigned at eye, NOT USABLE for spectral type of stars NOR for the color index, e.g.: 'black', 'reddish'
phys.sample.composition	src.sample;phys.composition;meta.note	rough description of the sample's composition, e.g.: 'olivine, magnetite and glass', 'plagioclase feldspar and anorthite'...
phys.sample.dusttype	scr.sample;meta.code.class	'Cosmic dust', 'Artificial terrestrial contamination'...
phys.sample.lat	src.sample;pos.bodyrc.lat	latitude of the finding location

Suggested UCD	Proposed UCD	Note
phys.sample.location	src.sample;pos	retrieval location of the sample, e.g.: 'Moon, Mare Serenitatis', 'Earth stratosphere, above Sahara desert', 'Interplanetary medium at 2 AU'...
phys.sample.long	src.sample;pos.bodyrc.long	longitude of the finding location
phys.sample.luster	src.sample;meta.code.class	luster of an object, e.g.: 'pearly', 'metallic', 'vitreous'... mineralogical property, generally assigned at eye
phys.sample.magnetized	src.sample;phys.magField;meta.code.class	'yes', 'no', 'partially'
phys.sample.mass	src.sample;phys.mass	mass of the sample
phys.sample.meteorclass	src.sample;meta.code.class	meteorite class: 'stony', 'iron', 'stony-iron'
phys.sample.meteorclass.stony	src.sample;meta.code.class	stony subclass: 'chondrite', 'achondrite'
phys.sample.parentbody	src.sample;meta.id.parent	Parent body of the sample, it can be generic or specific, very hard to recognize for dust, e.g.: 'Itokawa', 'asteroid', 'Moon'...
phys.sample.shape	src.sample;meta.code.class	shape of an object, e.g.: 'irregular', 'spherical'...
phys.sample.transparency	src.sample;meta.code.class	transparency of a solid, e.g.: 'opaque', 'translucent', 'transparent' mineralogical property, generally assigned at eye
phys.sample.type	src.sample;meta.note	Cosmic dust', 'Artificial terrestrial contamination', 'Lunar basalt'...
phys.porosity	src.sample;meta.code.class	porosity percentage of the body
src.id	src.sample;meta.id	Identifier of the object, e.g.: 'alpha CMa', 'Jupiter Sol-4', '2P/Encke', 'NGC 2683', it can coincide with src.name
src.name	src.sample;meta.id	Name of the object, e.g.: 'Sirius', 'Jupiter', 'Encke', 'NGC 2683', it can coincide with src.id
src.group	src.sample;meta.id.parent	group, family or dynamical class of the object, e.g.: 'Halley type comet', 'AGNII', 'Themis family asteroid'
src.asteroid	src.asteroid	related to asteroids
src.asteroid.family	src.asteroid ;meta.id.parent (?)	family or group to which an asteroid belongs, e.g.: 'Hygiea', 'Themis'...
src.asteroid.specclass	src.asteroid ;meta.code.class	spectral class of the asteroid, e.g.: 'B', 'C', 'S' ...

Suggested UCD	Proposed UCD	Note
src.asteroid.dynclass	src.asteroid ;meta.code.class	dynamical class of the asteroid, e.g.: 'NEO', Trojan', 'Main Belt'....
src.comet	src.comet	related to comets
src.comet.dynclassLev	src.comet ;meta.code.class	dynamic class according to Levison, e.g.: 'External', 'Encke'...

The list presented in table 1 is rather specific to planetary or cometary samples. It is difficult to set the right level of description, as most of the physical parameters are describing the aspect of the sample, and are set "by eye". It would be possible to add a new UCD category for "samples", in which we would have a definition like "Relative to a physical sample of a body". That would cover the description of meteorites, of samples returned from space, and of in-situ geological measurements (such as the data acquired by rovers on Mars). However, the "src.sample" may be used instead. In that case, we just need to add the previous definition to that UCD. It is clear however, that many keywords will have the same UCD: "*src.sample;meta.code.class*". That may be a problem, but this should be discussed with the IVOA semantics group, in order to compare with the astrophysical concepts. A few additional UCDs are proposed here: *src.comet* and *src.asteroid*

A second list of descriptors consists in measurable physical parameters. They are listed in Table 2.

Table 2. List of measurement UCDs proposed for Comets and Samples.

Suggested UCD	Proposed UCD	Note
phys.mol.elecband	phys.atmol.transition	electronic band of the transition
phys.mol.species	phys.atmol;meta.id	chemical species
phys.reflectance	phys.albedo	reflectance of the body
phys.size.smedAxis	phys.size.smedAxis	for 3d objects a third axis is necessary. linked to phys.size.smajAxis and phys.size.sminAxis
src.orbital.smajAxis	src;phys.size.smajAxis	«angSize» implies sky observation, not 3D measurement
src.orbital.TissJ	src.orbital.TissJ	Tisserand parameter respect to Jupiter
em.line.FeKalpha	em.line. FeKalpha	Fe K alpha line at 6.4 kev
em.molecline	em.line	Designation of molecular lines
em.molecline.C2	em.line.C2 ;meta.number	number of C2 lines in the observed range
em.molecline.C3	em.line.C3 ;meta.number	number of C3 lines in the observed range
em.molecline.CH	em.line.CH ;meta.number	number of CH lines in the observed range
em.molecline.NH2	em.line.NH2 ;meta.number	number of NH2 lines in the observed range
em.molecline.CN	em.line.CN ;meta.number	number of CN lines in the observed range

In conclusion, it is clear that we can use the UCDs for this type of science description, after a few additions. Some additions are straightforward and do not require too much discussion (e.g., adding "phys.size.smedAxis"). The list of molecular lines may be more problematic, because it opens the possibility to have a long (long!) list of possible molecules. The question should be seriously

discussed, as some lines are already there, but they fit with the astrophysical needs, not the planetary science ones.

discussion needed on "src" (definition = Observed source viewed on the sky). Change definition?. So that src can cover for other sources than sky objects (such as samples).

Case 2: Space Physics (i.e., plasma measurements in space)

This science case was studied by the "plasma node" (Toulouse and Meudon in France, as well as Graz, Austria). Space sciences (i.e., electromagnetic waves, electric and magnetic fields, and particle measurements in space) have been long using the SPASE data model to describe their data. We propose here a set of UCDs that should cover the needs of that community. Appendix 1 presents a study of SPASE compared to UCDs, that was done to be comprehensive. We present the list of discussed UCDs in table 3.

Table 3. List of UCDs proposed for Planetary Plasmas.

Suggested UCD	Proposed UCD	Note
phys.count	phys.count	Same as <i>phot.count</i> , but not restricted to photometric measurements.
phys.particle	phys.particle	relative to particle physics. This UCD does not exist, although <i>phys.particle.neutrino</i> does.
phys.particle.aerosol	phys.particle.aerosol	SPASE Particle.ParticleType.Aerosol defined as: A suspension of fine solid or liquid particles in a gas.
phys.particle.alpha	phys.particle.alpha	SPASE Particle.ParticleType.Alpha defined as: A positively charged nuclear particle that consists of two protons and two neutrons.
phys.particle.atom	phys.atmol	SPASE Particle.ParticleType.Atom defined as: Matter consisting of a nucleus surrounded by electrons which has no net charge.
phys.particle.dust	phys.particle.dust	SPASE Particle.ParticleType.Dust defined as: Free microscopic particles of solid material.
phys.particle.electron	phys.electron	SPASE Particle.ParticleType.Electron defined as: An elementary particle consisting of a charge of negative electricity equal to about 1.602×10^{-19} Coulomb and having a mass when at rest of about 9.109534×10^{-28} gram.
phys.particle.ion	phys.atmol.ionstage	SPASE Particle.ParticleType.Ion defined as: An atom that has acquired a net electric charge by gaining or losing one or more electrons.(Note: $Z > 2$).
phys.particle.molecule	phys.atmol	SPASE Particle.ParticleType.Molecule defined as: A group of atoms so united and combined by chemical affinity that they form a complete, integrated whole, being the smallest portion of any particular compound that can exist in a free state.
phys.particle.neutron	phys.particle.neutron	SPASE Particle.ParticleType.Neutron defined as: An elementary particle that has no net charge and is a constituent of atomic nuclei, and that has a mass slightly large than a proton (1.673×10^{-24} gram.)

Suggested UCD	Proposed UCD	Note
phys.particle.proton	phys.particle.proton	SPASE Particle.ParticleType.Proton defined as: An elementary particle that is a constituent of all atomic nuclei, that carries a positive charge numerically equal to the charge of an electron, and that has a mass of 1.673×10^{-24} gram.
em.pw	em.pw	Plasma wave part of the electromagnetic spectrum. These waves are measured locally. They are trapped below their cutoff frequencies, and cannot escape toward free-space.
phys.energy.flux	phys.energy.flux	To be used instead of <i>phot.energy.flux</i> , when not referring to photometry (e.g., for particles).
phys.flow	phys.flow	Relative to flow of particle or matter
phys.gyrofrequency	phys.magfield;em.freq	The number of gyrations around a magnetic guiding center (field line) a charged particle makes per unit time due to the Lorentz force.
phys.plasmafrequency	phys.density;phys.atmol;em.freq	A number-density-dependent characteristic frequency of a plasma.
phys.heatflux	phys.heatflux or phys.energy;phys.flow	Flow of thermal energy through a gas or plasma; typically computed as third moment of a distribution function.
phys.phasespacedensity	phys.density.phasespace	The number of particles per unit volume in the six-dimensional space of position and velocity.
em.radio.50-100MHz	em.radio.50-100MHz	Radio between 50 and 100 MHz
em.radio.10-50MHz	em.radio.10-50MHz	Radio between 10 and 50 MHz
em.radio.below10MHz	em.radio.below10MHz	Radio below 10 MHz

The question of having UCDs for describing the energy bands for particle (electrons, ions or neutral) measurements in terms of ranges in eV, keV or MeV, similarly to what is done with the em group. The same applies for mass spectroscopy, in atomic mass unit [amu], as well as in mass per charge units. It seems that we don't want to put this type of information in UCDs (that would lead to a large increase of the allowed keywords) but there is a need to differentiate at least low energy (below 100 eV, TBC), middle energy (100 eV to 100 keV, TBC) and high energy (above 100 keV, TBC) particle in a magnetospheric context.

Case 3: Imaging and Spectroscopy

Inputs for this section were collected from the LESIA group (Meudon, France). A set of new UCDs was proposed, and studied in order to see how each of them could be described with existing UCDs. The studied list is presented in Table 4.

Table 4. List of UCDs proposed for Imaging and Spectroscopy.

Suggested UCD	Proposed UCD	Note
em.UV.EUV	em.UV.EUV	next to <i>em.UV.FUV</i>
em.band	em.line.band	similarly to em.line, but for molecular bands
em.band.CH4	em.line.band.CH4	relative to CH4 molecular bands

Suggested UCD	Proposed UCD	Note
em.band.H2O	em.line.band.H2O	relative to H2O molecular bands
em.band.CO2	em.line.band.CO2	relative to CO2 molecular bands
meta.id.coPI	meta.id.coPI	Name of Co-Principal-Investigator
meta.processed	meta.processed	obtained through a processing pipeline
meta.derived	meta.derived	obtained from a combination of observation and/or models
em.molecline.rotation	em.line;phys.mol.rotation	
em.molecline.vibration	em.line;phys.mol.vibration	
obs.calib.dark	obs.calib.dark	next to <i>obs.calib.flat</i>
phot.radiance	phot.radiance	
phot.reflectance	phys.albedo	
pos.occult	pos.limb;obs.occult	
src.orbital.smajAxis	src.orbital;phys.size.smajAxis	
src.orbital.sminAxis	src.orbital;phys.size.sminjAxis	
src.orbital.number	src.orbital.number	number of the current revolution
time.period.number	time.period.number	number of the current rotation, e.g., day number on Earth

The problem of molecular lines also arises from this study, as in case 1. Some propositions are rather generic and may be included easily (meta.id.coPi, meta.processed, meta.derived, obs.calib.dark...).

3. UCDs for Solar and Heliophysics

Inputs in this section were collected by the HELIO project (many groups in Europe). Very few UCDs were proposed for addition, and are listed in Table 5.

Table 5. List of UCDs proposed for Solar and Heliophysics.

Suggested UCD	Proposed UCD	Note
time.period.number	time.period.number	number of the current rotation, e.g., day number on Earth, or the number of Carrington rotation of the Sun
instr.obsty.experiment	instr.obsty.experiment	relative to the instrument suite (experiment) in which the instrument is place. This is a usual description in space borne instrumentation.
pos.heliographic	pos.heliographic	centered on the center of the sun as seen from observer

It is noticeable that one of the few UCDs proposed here is also proposed in case 3 (time.period.number).

Still unsolved topic: can we describe active/passive or in-situ/remote concepts with UCDs?

4. Discussion

Although it is an ongoing work, and more use cases will help us to propose a complete set of UCDs, it is clear that the current UCDs list is more or less acceptable, to a few additions. There are two big questions that have to be addressed. The first is the way to describe atomic and molecular bands. If we follow the path outlined in the current version of UCDs, it is clear that the number of UCDs will grow very fast, in order to include all observed species and molecules (a lot in planetary sciences). The same type problem arises with the low frequency electromagnetic spectrum (not included below 100 MHz), and for mass spectroscopy and particle physics experiments. The second issue is linked to empirical descriptions of data (e.g., qualifiers determined "by eye"), as described in Case 1. The natural trend (consistent with current use of UCDs) would be to describe them as "*meta.code.class*" (or similar), but then all are described the same way, without any possibility to differentiate them at the UCD level.

While building UCDs, we also realized that there is a temptation to use them as a data model. This is not intended, but is difficult to be restrained by newcomers to UCDs.

It is also worth emphasizing that we did not identify the need for a new "main category".

Discuss if the initial goal of using UCDs for "Measurement Types" information is reached. Probably not.

Appendix 1. SPASE metadata for measurement description

In the SPASE data model, there are various keywords that can be mapped to UCDs: Field Type, Measurement Type, Particle Type, Quantity, Qualifier, Spectral Range, Wave Type.

The definition of these concepts in SPASE are presented in the table below. As for the previous tables, bold face UCDs do not exist in the IVOA standard. We also highlighted in italics UCD equivalents that are arguable.

SPASE-DM Concept	Definition of Concept	Allowed values if applicable (+ links to SPASE dict.)	Proposed UCD equivalent when applicable
Field	The space around a radiating body within which its electromagnetic attributes can exert force on another similar body that is not in direct contact.	N/A	N/A
Field Type	The physical attribute of the field.	Current	<i>phys.electron;phys.flow</i>
		Electric	phys.elecField
		Electromagnetic	em
		Gyrofrequency	phys.magfield;em.freq
		Magnetic	phys.magField

SPASE-DM Concept	Definition of Concept	Allowed values if applicable (+ links to SPASE dict.)	Proposed UCD equivalent when applicable
		Plasma Frequency	phys.density;phys.electron;em.freq
		Potential	phys.potential
		Poynting Flux	phys.energy.flux
Measurement Type	A characterization of the quantitative assessment of a phenomenon.	Activity Index	meta.code;phys.magfield
		Dopplergram	phys.veloc
		Dust	phys.particle.dust
		Electric Field	phys.elecField
		Energetic Particles	phys.particle
		Ephemeris	pos.bodyrc
		Image Intensity	phot
		Instrument Status	instr.setup;meta.code.status
		Ion Composition	phys.atmol.ionStage
		Irradiance	phot.flux
		Magnetic Field	phys.magField
		Magnetogram	phys.magField
		Neutral Atom Images	phys.atmol
		Neutral Gas	phys.atmol
		Profile	N/A
		Radiance	phot.flux.density
		Spectrum	N/A
		Thermal Plasma	phys.particle
		Waves	em.radio <i>or</i> em.pw
Waves.Active	N/A		
Waves.Passive	N/A		
Mixed	A parameter derived from more than one of the type of parameter. For example, plasma beta, the ratio of plasma particle energy density to the energy density of the magnetic field permeating the plasma, is "mixed."	N/A	N/A
Mixed Quantity	A characterization of the combined attributes of a quantity.	Akasofu Epsilon	phys.energy.flux;meta.code
		Alfven Mach Number	arith.ratio;phys.veloc

SPASE-DM Concept	Definition of Concept	Allowed values if applicable (+ links to SPASE dict.)	Proposed UCD equivalent when applicable
		Alfven Velocity	phys.magfield;phys.veloc
		Frequency-To-Gyrofrequency Ratio	arith.ratio;em.freq
		Magnetosonic Mach Number	arith.ratio;phys.veloc
		Other	N/A
		Plasma Beta	arith.ratio;phys.pressure;phys.magField
		Total Pressure	phys.pressure
		V Cross B	phys.elecField
Particle	A description of the types of particles observed in the measurement. This includes both direct observations and inferred observations.	N/A	phys.particle
Particle Quantity	A characterization of the physical properties of the particle.	Arrival Direction	pos.bodyrc
		Atomic Number Detected	phys.atmol.number
		Average Charge State	stat.mean;phys.atmol.ionstage;meta.number
		Charge State	phys.atmol.ionstage;meta.number
		Count Rate	arith.rate;phys.count
		Counts	phys.count
		Energy	phys.energy
		Energy Density	phys.energy.density
		Energy Flux	phys.energy.flux
		Flow Speed	phys.flow;phys.veloc
		Flow Velocity	phys.flow;phys.veloc
		Gyrofrequency	phys.magfield;em.freq
		Heat Flux	phys.heatflux
		Mass	phys.mass
		Mass Density	phys.density;phys.mass
		Mass Number	phys.atmol.number
		Number Density	phys.density;meta.number
		Number Flux	phys.flux ;meta.number

SPASE-DM Concept	Definition of Concept	Allowed values if applicable (+ links to SPASE dict.)	Proposed UCD equivalent when applicable
		Phase-Space Density	phys.density.phasespace
		Plasma Frequency	phys.density;phys.atmol;em.freq
		Pressure	phys.pressure
		Sonic Mach Number	arith.ratio;phys.veloc
		Sound Speed	phys.veloc
		Temperature	phys.temperature
		Thermal Speed	phys.veloc;phys.temperature
		Velocity	phys.veloc
Qualifier	Characterizes the refinement to apply to a type or attribute of a quantity.	Anisotropy	
		Array	
		Average	stat.mean
		Characteristic	
		CircularColumn	
		Component	
		Component.I	
		Component.J	
		Component.K	
		Cross Spectrum	
		Deviation	
		Differential	arith.diff
		Direction	
		Direction Angle	pos.pang
		Direction Angle.Azimuth Angle	
		Direction Angle.Elevation Angle	
		Direction Angle.Polar Angle	
		Field-Aligned	
		Fit	
		Group	
		Integral	

SPASE-DM Concept	Definition of Concept	Allowed values if applicable (+ links to SPASE dict.)	Proposed UCD equivalent when applicable
		Integral.Area	
		Integral.Bandwidth	
		Integral.Solid Angle	
		Line Of Sight	
		Linear	
		Magnitude	
		Moment	
		Parallel	
		Peak

		Phase	
		Phase Angle	
		Projection	
		Projection.IJ	
		Projection.IK	
		Projection.JK	
		Pseudo	
		Ratio	arith.ratio
		Scalar	
		Spectral	
		Standard Deviation	
		Stoke's Parameters	
		Symmetric	
		Tensor	
		Total	
		Trace	
		Uncertainty	
		Variance	
		Vector	
Spectral Range	The general term used to describe wavelength or frequency within a	Ca-K	em.line.CaK

SPASE-DM Concept	Definition of Concept	Allowed values if applicable (+ links to SPASE dict.)	Proposed UCD equivalent when applicable
Range	wavelengths or frequencies within a given span of values for those quantities.	Extreme Ultraviolet	em.UV.EUV
		Far Ultraviolet	em.UV.FUV
		Gamma Rays	em.gamma
		H-alpha	em.line.Halpha
		Hard X-rays	em.X-ray.hard
		He-10830	em.line.He-10830
		He-304	em.line.He-304
		Infrared	em.IR
		K-7699	em.line.K-7699
		LBH Band	em.line.LBH
		Microwave	em.mm
		Na-D	em.line.NaD
		Ni-6768	em.line.Ni-6768
		Optical	em.opt
		Radio Frequency	em.radio or em.pw
		Soft X-Rays	em.X-ray.soft
		Ultraviolet	em.UV
White-Light	em.opt		
X-Rays	em.X-ray		
Wave	Periodic or quasi-periodic (AC) variations of physical quantities in time and space, capable of propagating or being trapped within particular regimes.	N/A	em.radio or em.pw
Wave Type	A characterization of the carrier or phenomenon of wave information observed by the measurement.	Electromagnetic	phys.elecField;phys.magField
		Electrostatic	phys.elecField
		Hydrodynamic	
		MHD	
		Photon	phot
		Plasma Waves	em.pw
Wave Quantity	A characterization of the physical properties of a wave.	Absorption	phys.absorption
		AC-Electric Field	phys.elecField

SPASE-DM Concept	Definition of Concept	Allowed values if applicable (+ links to SPASE dict.)	Proposed UCD equivalent when applicable
		AC-Magnetic Field	phys.magField
		Doppler Frequency	em.freq;phys.veloc
		Emissivity	phys.emissivity
		Energy Flux	phys.energy.flux
		Equivalent Width	spect.line.eqWidth
		Frequency	em.freq
		Gyrofrequency	phys.magfield;em.freq
		Intensity	phys.energy.density (?)
		Line Depth	spect.line.depth
		Magnetic Field	phys.magField
		Mode Amplitude	src.var.amplitude
		Plasma Frequency	phys.density;phys.electron;em.freq
		Polarization	phys.polarization
		Poynting Flux	phys.energy.flux
		Propagation Time	time.duration
		Stoke's Parameters	phys.polarization
		Velocity	phys.veloc
		Wavelength	em.wl

These metadata can't all be mapped to UCDs. Some of them are referring to the physical quantity. These keywords can be linked to UCDs. Some other are describing the organization of the data (mainly in the *Measurement Type* concept).

Appendix 2. UCDs used to describe AMDA (Automated Multi Data Analysis) tool datasets

In order to prepare the EPN-TAP interface to the AMDA database at CDP (Toulouse), we have selected UCDs for all datasets of that database. The following table provides the list of these UCDs, with the name, definition and unit (when available) of the described parameters. This list should be used the same way as the results of the GAVO UCD resolver¹⁰.

UCD	Name	Description	Unit
instr.setup;pos.posAng	angle	Angular position of the actuator	deg
meta.code	method	method code	none

¹⁰ <http://dc.zah.uni-heidelberg.de/ucds/ui/ui/form>

UCD	Name	Description	Unit
	scan_mode	Scan mode	none
meta.code;instr.setup	telemetry_mode	Telemetry mode	
meta.code;phys.magField	Kp	Kp Geomagnetic index	no
meta.code.qual;phys.magField	quality_MAG	MAG quality flag	0:B_inside
	quality_PLA	PLA quality flag	0:corrected_by_PLA

Appendix 3. PDS data dictionary

The PDS (NASA Planetary Data System) Data Dictionary (PSDD) has several entities that can be matched to UCDs. The main relevant keyword is INSTRUMENT_PARAMETER_NAME. The INSTRUMENT_PARAMETER_NAME element provides the name of the data parameter which was

measured by an instrument. As an example, the INSTRUMENT_PARAMETER_NAME value could be "ELECTRIC FIELD COMPONENT". It is intended that the INSTRUMENT_PARAMETER_NAME element provide the name of the rawest measured value which has some physical significance. Thus, for example, while the detector of an instrument may actually record voltage differences, the electric field component which is proportional to those differences is considered to be the instrument parameter.

INSTRUMENT PARAMETER NAME	Proposed UCD
ATMOSPHERIC PRESSURE	phys.pressure
ATMOSPHERIC TEMPERATURE	phys.pressure
ATOMIC NUMBER (Z)	phys.atmol.number
DYNAMIC	
BRIGHTNESS	phot.flux.sb
D1 RATE	arith.rate
D2 RATE	arith.rate
ELECTRIC FIELD COMPONENT	phys.elecField
ELECTRIC FIELD WAVEFORM	phys.elecField
ELECTRON CURRENT	phys.flow ;phys.electron
ELECTRON RATE	arith.rate;phys.electron
ENERGY/NUCLEON	phys.energy
ION CURRENT	phys.flow;phys.atmol.ionStage
ION RATE	arith.rate;phys.atmol.ionStage
MAGNETIC FIELD COMPONENT	phys.magField
N/A	
PARTICLE MULTIPLE PARAMETERS	phys.particle
PARTICLE RATE	arith.rate; phys.particle
PHOTON FLUX	phot.flux
PLANETARY RADIUS	phys.size.radius
POSITION VECTOR	pos
PRESSURE	phys.pressure
RADAR ECHO POWER	phys.power
RADIANCE	phys.radiance
RADIANT POWER	phys.power
RSSDETEB POWER	??
SPECTRAL INTENSITY	spect.line.intensity ?
SPECTRAL RADIANCE	??
TEMPERATURE	phys.temperature
UNK	meta.cryptic
WAVE ELECTRIC FIELD AMPLITUDE	phys.elecField
WAVE ELECTRIC FIELD INTENSITY	phys.elecField
WAVE FLUX DENSITY	phys.flux.density
WAVE MAGNETIC FIELD INTENSITY	phys.magField

INSTRUMENT PARAMETER NAME	Proposed UCD
WIND DIRECTION	phys.posAng
WIND SPEED	phys.veloc
WIND VELOCITY	phys.veloc

As there is no definition for the values (which are simply extracted from the existing database, so there is only little control on that parameter value).

Other entities can be mapped to UCDs, such as the CLASSES and DESCRIPTORS concepts defined in the PSDD (section 2.2.2, in Aug. 2002 version). Those entities are bricks to build PDS keywords. This mapping can thus be used to help building corresponding UCDs.

CLASS WORD	CLASS WORD DEFINITION	Proposed UCD
count	A numeric value indicating a current total or tally. The class word count is implied by the use of plural descriptor words such as lines, bytes or bits. For example, LINES = 800 is interpreted as LINE_COUNT = 800.	phys.count
date	A representation of time in which the smallest unit of measure is a day. The value is expressed in one of the standard forms. Example: PUBLICATION_DATE = 1959-05-30	time.epoch
description	A free-form, unlimited-length character string that provides a description of the item identified. Example: MISSION_DESC provides the description of a mission, as in The Magellan spacecraft was launched from the Kennedy Space Center on May 5, 1989. The spacecraft was deployed from the Shuttle cargo bay.... See also: the class word TEXT. Note: In the PDS, this term is abbreviated to DESC in every instance except when the word is unqualified. Hence, the data element name DESCRIPTION is spelled out, but INSTRUMENT_DESC contains the abbreviation.	meta.note
direction	A literal value indicating the line or course on which something is moving, pointing or facing. For example, NORTH, SOUTH, INGRESS, EGRESS, RETROGRADE, PROGRADE	pos;meta.code
flag	A boolean condition indicator, limited to two states. Example: PLANETARY_OCCULTATION_FLAG = Y	meta.flag
format	A specified or predetermined arrangement of data within a file or on a storage medium.	meta.code
group	Names a collection or aggregation of elements. Example: ALT_FLAG_GROUP	meta.id
id	A shorthand alphanumeric identifier. In some cases, a notation representing a shortened name of an NAME. See abbreviation standard. See also: 'name'. Example: SPACECRAFT_ID = VG1	meta.id
mask	An unsigned numeric value representing the bit positions within a value. Example: SAMPLE_BIT_MASK = 2#00011111#	meta.code
name	A literal value representing the common term used to identify an element. See also: 'id'. Example: SPACECRAFT_NAME = MAGELLAN.	meta.id
note	A textual expression of opinion, an observation, or a criticism; a remark.	meta.note

CLASS WORD	CLASS WORD DEFINITION	Proposed UCD
number	A quantity associated with an NAME. Example: START_SAMPLE_NUMBER = 5	meta.number
range	Numeric values which identify the starting and stopping points of an interval. Note: the use of the descriptor word 'distance' supersedes the use of the word 'range' as a measure of linear separation See: 'distance'. Example: IRAS_CLOCK_ANGLE_RANGE	stat.range
ratio	The relation between two quantities with respect to the number of times the first contains the second. Example: DETECTOR_ASPECT_RATIO	arith.ratio
sequence	1) an arrangement of items in accordance with some criterion that defines their spacewise or timewise succession; 2) an orderly progression of items or operations in accordance with some rule, such as alphabetical or numerical order.	obs.sequence ?
set	A collection of items having some feature in common or which bear a certain relation to one another, e.g. all even numbers.	
summary	An abridged description. Example: SCIENTIFIC_OBJECTIVES_SUMMARY	meta.note
text	A free-form, unlimited length character string that represents the value of a data element. Example: ADDRESS_TEXT provides the value of an address, such as 4800 Oak Grove Dr. Pasadena, CA 91109. In contrast, ADDRESS_DESC would describe an address such as An address consists of a street, city, state, and zip code. See also: the class word DESCRIPTION.	meta.note
time	A value that measures the point of occurrence of an event expressed as date and time in a standard form. Example: START_TIME = 1987-06-21T17:30:30.00	time.epoch
type	A literal that indicates membership in a predefined class. See: standard values for data elements. Example: TARGET_TYPE = PLANET	
unit	A determinate quantity adopted as a standard of measurement.	meta.unit
value	The default class word for data element names not terminated with a class word. It represents the amount or quantity of a data element. For example, SURFACE_TEMPERATURE = 98.6 would be interpreted as SURFACE_TEMPERATURE_VALUE = 98.6.	
vector	A quantity that has both length and direction which are independent of both the units and of the coordinate system in which each are measured. The vector direction is uniquely defined in terms of an ordered set of components with respect to the particular coordinate system for which those components have been defined.	

DESCRIPTOR WORD	CLASS WORD DEFINITION	Suggested UCDs
albedo	Reflectivity of a surface or particle. Example: BOND_ALBEDO	phys.albedo

DESCRIPTOR WORD	CLASS WORD DEFINITION	Suggested UCDs
altitude	The distance above a reference surface measured normal to that surface. Altitudes are not normally measured along extended body radii, but along the direction normal to the geoid; these are the same only if the body is spherical. See also: 'elevation', 'height.' Example: SPACECRAFT_ALTITUDE	pos.bodyrc.alt
angle	A measure of the geometric figure formed by the intersection of two lines or planes. Definitions for data element names containing the word 'angle' should include origin and relevant sign conventions where applicable. Example: MAXIMUM_EMISSION_ANGLE	pos.posAng
axis	A straight line with respect to which a body or figure is symmetrical. Example: ORBITAL_SEMIMAJOR_AXIS	
azimuth	One of two angular measures in a spherical coordinates system. Azimuth is measured in a plane which is normal to the principal axis, with increasing azimuth following the right hand rule convention relative to the positive direction of the principal axis. PDS adopts the convention that an azimuth angle is never signed negative. The point of zero azimuth must be defined in each case.	pos.az
bandwidth	The range within a band of wavelengths, frequencies or energies.	meta.code
bits	A quantity to be added to a value.	meta.id
base	A count of the number of bits within an elementary data item. Examples: SAMPLE_BITS	
bytes	A count of the number of bytes within a record, or within a sub-component of a record. Example: RECORD_BYTES	
channel	A band of frequencies or wavelengths.	meta.id
circumference	The length of any great circle on a sphere.	
coefficient	A numeric measure of some property or characteristic.	
columns	A count of the number of distinct data elements within a row in a table.	
component	1) The part of a vector associated with one coordinate. 2) A constituent part. Example: VECTOR_COMPONENT_1	
constant	A value that does not change significantly with time.	meta.code
consumption	The usage of a consumable. Example: INSTRUMENT_POWER_CONSUMPTION	instr.param
contrast	The degree of difference between things having a comparable nature. Example: MAXIMUM_SPECTRAL_CONTRAST	arith.ratio
declination	An angular measure in a spherical coordinate system, declination is the arc between the Earth's equatorial plane and a point on a great circle perpendicular to the equator. Positive declination is measured towards the Earth's north pole, which is the positive spin axis per the right hand rule; declinations south of the equator are negative. The Earth mean equator and equinox shall be as defined by the International Astronomical Union (IAU) as The 'J2000' reference system unless noted as The 'B1950' reference system. See also: 'right_ascension'.	pos.eq.dec

DESCRIPTOR WORD	CLASS WORD DEFINITION	Suggested UCIDs
density	1) The mass of a given body per unit volume. 2) The amount of a quantity per unit of space. Example: MASS_DENSITY	phys.density
detectors	A count of the number of detectors contained, for example, in a given instrument.	meta.number
Deviation	Degree of deviance.	stat.stdev
diameter	The length of a line passing through the center of a circle or a circular NAME. Example: TELESCOPE_DIAMETER	phys.size.diameter
distance	A measure of the linear separation of two points, lines, surfaces, or NAMEs. See also 'altitude', which refers to a specific type of distance. The use of the descriptor word 'distance' supersedes the use of the word 'range' as a measure of linear separation. See also: 'range'. Example: SLANT_DISTANCE	pos.distance
duration	A measure of the time during which a condition exists. Example: INSTRUMENT_EXPOSURE_DURATION	time.duration
eccentricity	A measure of the extent to which the shape of an orbit deviates from circular. Example: ORBITAL_ECCENTRICITY	src.orbital.eccentricity
elevation	1)The distance above a reference surface measured normal to that surface. Elevation is the altitude of a point on the physical surface of a body measured above the reference surface; height is the distance between the top and bottom of an NAME. 2)An angular measure in a spherical coordinate system, measured positively and negatively on a great circle normal to the azimuthal reference plane. The zero elevation point lies in the azimuthal reference plane, and positive elevation is measured towards the direction of the positive principal axis. See also: 'azimuth'.	pos.posAng
epoch	A specific instance of time selected as a point of reference. Example: COORDINATE_SYSTEM_REFERENCE_EPOCH	time.epoch
error	The difference between an observed or calculated value and a true value. Example: TELESCOPE_T_NUMBER_ERROR	stat.error
factor	A quantity by which another quantity is multiplied or divided. Example: SAMPLING_FACTOR	arith.factor
first	An indication of the initial element in a set or sequence. As with minimum and maximum, the values in the set may be out of order or discontinuous. For examples of the use of range-related terms, please see the following section.	stat.min;meta.number
flattening	A measure of the geometric oblateness of a solar system body, defined as the ratio of the difference between the body's equatorial and polar diameters to the equatorial diameter, or '(a-c)/a'.	phys.size.radius;arith.ratio
fov (field_of_view)	The angular size of the field viewed by an instrument or detector. Note that a field may require multiple field_of_view measurements, depending upon its shape (e.g., height and width for a rectangular field). Example: HORIZONTAL_FOV	instr.fov
fovs	A count of the number of different fields of view characteristic of an instrument or detector.	instr.fov;meta.number
Fraction	The non-integral part of a real number. See also: 'base'.	

DESCRIPTOR WORD	CLASS WORD DEFINITION	Suggested UCDs
frequency	The number of cycles completed by a periodic function in unit time.	em.freq
gravity	The gravitational force of a body, nominally at its surface. Example: SURFACE_GRAVITY	phys.gravity
height	The distance between the top and bottom of an NAME. Example: SCALED_IMAGE_HEIGHT	
images	A count of the number of images contained, for example, in a given mosaic. Example: MOSAIC_IMAGES	obs.image;meta.number
inclination	The angle between two intersecting planes, one of which is deemed the reference plane and is normally a planet's equatorial plane as oriented at a	pos.posAng
index	An indicator of position within an arrangement of items.	meta.number
interval	1)The intervening time between events. 2)The distance between points along a coordinate axis. See also: 'duration'. Example: SAMPLING_INTERVAL	time.interval ?
last	An indication of the final element in a set or sequence. As with minimum and maximum, the values in the set may be out of order or discontinuous. For examples of the use of range-related terms, please see the following section.	stat.max;meta.number
latitude	In a cylindrical coordinate system the angular distance from the plane orthogonal to the axis of symmetry. See also: 'longitude'. Example: MINIMUM_LATITUDE	pos.bodyrc.lat
length	A measured distance or dimension. See also: 'height', 'width'. Example: TELESCOPE_FOCAL_LENGTH	phys.size
level	The magnitude of a continuously varying quantity. Example: NOISE_LEVEL	
line	1)A row of data within a two-dimensional data set; 2)A narrow feature within a spectrum.	spect.line
lines	1)A count of the number of data occurrences in an image array; 2)Any plural of 'line'.	
location	The position or site of a NAME	pos.bodyrc
longitude	n a cylindrical coordinate system, the angular distance from a standard origin line, measured in the plane orthogonal to the axis of symmetry. (See also: 'latitude'.) Example: MAXIMUM_LONGITUDE	pos.bodyrc.long
mass	A quantitative measure of a body's resistance to acceleration. Example: INSTRUMENT_MASS	phys.mass

DESCRIPTOR WORD	CLASS WORD DEFINITION	Suggested UCDs
maximum	An indicator of the element in a range that has the greatest value, regardless of the order in which the values are listed or stored. For example, in the set {4, 5, 2, 7, 9, 3}, the minimum is 2, the maximum is 9. The use of minimum and maximum, as with first and last implies that the set may be out of order or discontinuous. For examples of the use of range-related terms, please see the following section.	stat.max
minimum	An indicator of the element in a range that has the least value, regardless of the order in which the values are listed or stored. For example, in the set {4, 5, 2, 7, 9, 3}, the minimum is 2, the maximum is 9. The use of minimum and maximum, as with first and last implies that the set may be out of order or discontinuous. For examples of the use of range-related terms, please see the following section.	stat.min
moment	The product of a quantity (such as a force) and the distance to a particular point or axis. Example: MAGNETIC_MOMENT	
obliquity	Angle between a body's equatorial plane and its orbital plane.	pos.posAng
parameter	A variable. Example: MAXIMUM_SAMPLING_PARAMETER	
parameters	A count of the number of parameters in a given application. Example: IMPORTANT_INSTRUMENT_PARAMETERS	meta.number
password	An alphanumeric string which must be entered by a would-be user of a computer system in order to gain access to that system.	meta.code;meta.cryptic :-)
percentage	A part of a whole, expressed in hundredths. Example: DATA_COVERAGE_PERCENTAGE	arith.ratio
period	The duration of a single repetition of a cyclic phenomenon or motion. Example: REVOLUTION_PERIOD	time.period
points	A count of the number of points (i.e., data samples) occurring, for example, within a given bin. Example: BIN_POINTS	meta.number
pressure	Force per unit area. Example: MEAN_SURFACE_ATMOSPHERIC_PRESSURE	phys.pressure
radiance	A measure of the energy radiated by an NAME. Example: SPECTRUM_INTEGRATED_RADIANCE	
radius	The distance between the center of and a point on a circle, sphere, ellipse or ellipsoid. Example: MEAN_INNER_RADIUS	phys.size.radius
rate	The amount of change of a quantity per unit time. Example: NOMINAL_SPIN_RATE	arith.rate
records	A count of the number of physical or logical records within a file or a subcomponent of a file. Example: FILE_RECORDS	meta.number
resolution	A quantitative measure of the ability to distinguish separate values. Example: SAMPLING_PARAMETER_RESOLUTION	

DESCRIPTOR WORD	CLASS WORD DEFINITION	Suggested UCDs
right ascension	The arc of the celestial equator between the vernal equinox and the point where the hour circle through the given body intersects the Earth's mean equator reckoned eastward, in degrees. The Earth mean equator and equinox shall be as defined by the International Astronomical Union (IAU) as the 'J2000' reference system unless noted as the 'B1950' reference system. Note: In the PDS, this term is abbreviated to RA in most instances, except when the term is unqualified. Hence, the data element name RIGHT_ASCENSION is spelled out, but other terms referring to specific right ascensions contain the abbreviation.	pos.eq.ra
rows	A count of the number of data occurrences in a table.	meta.number
samples	A count of the number of data elements in a line of an image array or a set of data. Example: SEQUENCE_SAMPLES	meta.number
scale	A proportion between two sets of dimensions. Example: MAP_SCALE	instr.scale
start	An indication of the beginning of an activity or observation. For examples of the use of range-related terms, please see the following section.	time.start
stop	An indication of the end of an activity or observation. For examples of the use of range-related terms, please see the following section.	time.end
temperature	The degree or intensity of heat or cold as measured on a thermometric scale. Example: MEAN_SURFACE_TEMPERATURE	phys.temperature
title	A descriptive heading or caption. Example: SEQUENCE_TITLE	meta.title
transmittance	The ratio of transmitted to incident energy. Example: TELESCOPE_TRANSMITTANCE	
wavelength	The distance that a wave travels in one cycle. Example: MINIMUM_WAVELENGTH	em.wl
width	The distance between two sides of an NAME. See also: 'height', 'length'. Example: SCALED_IMAGE_WIDTH	phys.size
